

Use

SYNTHROID® (levothyroxine sodium tablets, USP) is a prescription synthetic thyroid hormone that is used to treat a condition called hypothyroidism. It is intended to replace a hormone that is normally produced by your thyroid gland. Generally, thyroid replacement therapy is to be taken for life.

The following testimonials are from actual Synthroid patients. Individual results may vary. Individuals with hypothyroidism, or who think they may have hypothyroidism, should speak with a doctor about the treatment option that is right for them.

Libby

When Libby was diagnosed with hypothyroidism at age 14, her doctor prescribed Synthroid. However, Libby regularly missed her doses — and when she did take her medication, it wasn't at a consistent time. It wasn't until she found out she was pregnant that she knew she had to take charge and learn more about her condition and the ways to manage it. Libby and her husband worked with an endocrinologist to monitor her thyroid-stimulating hormone (TSH) levels.

Shannon

Shannon discovered her hypothyroidism diagnosis shortly after she got married in 2001. Initially she attributed the fatigue and extra weight gain to "letting herself go" after the big day, but when she realized she was moving more and more slowly, she knew something was wrong. So Shannon spoke with her doctor, who diagnosed her with hypothyroidism. After hearing about a friend's experience with Synthroid, she asked her doctor if Synthroid would be right for her. Shannon was happy to have an answer and take a proactive part in managing her health.

SYNTHROID is a prescription synthetic thyroid hormone that is used to treat a condition called hypothyroidism. It is intended to replace a hormone that is normally produced by your thyroid gland. Generally, thyroid replacement therapy is to be taken for life.

Safety Considerations

Thyroid hormones, including SYNTHROID, should not be used for the treatment of obesity or weight loss. Large doses of thyroid hormone, especially when used with certain medicines that reduce appetite, can result in serious and even life-threatening effects. Talk to your doctor about any medication and food allergies, all medications you are taking, pregnancy plans, and all medical conditions you may have, especially heart disease, diabetes, clotting disorders, and adrenal or pituitary gland problems. Tell your doctor if you experience rapid or irregular heartbeat, chest pain, shortness of breath, leg cramps, headache, nervousness, irritability, sleeplessness, tremors, change in appetite, weight gain or loss, vomiting, diarrhea, excessive sweating, heat intolerance, fever, changes in menstrual periods, hives or skin rash, or any other unusual medical event.

Please see the next page for Important Safety Information, including warning about misuse in weight loss.

Important Safety Information

- Thyroid hormones, including SYNTHROID (levothyroxine sodium tablets, USP), should not be used either alone or in combination with other medicines for the treatment of obesity or weight loss. In patients with normal thyroid levels, doses of SYNTHROID within the typical range used for hormone replacement are not effective for weight loss. Larger doses may result in serious or even life-threatening effects, especially when used in combination with certain other drugs used to reduce appetite.
- Notify your physician if you are allergic to any foods or medicines, are pregnant or intend to become pregnant, are breast-feeding or are taking any other medications, including prescription and over-the counter preparations.
- Notify your physician of any other medical conditions you may have, particularly heart disease, diabetes, clotting disorders, and adrenal or pituitary gland problems. Your dose of medications used to control these other conditions may need to be adjusted while you are taking SYNTHROID. If you have diabetes, monitor your blood and/or urinary glucose levels as directed by your physician and immediately report any changes to your physician. If you are taking anticoagulants (blood thinners), your clotting status should be checked frequently.
- Use SYNTHROID only as prescribed by your physician. Do not discontinue or change the amount you take, or how often you take it, unless directed to do so by your physician.
- Agents such as iron and calcium supplements and antacids can decrease the absorption of levothyroxine sodium tablets. Therefore, levothyroxine sodium tablets should not be administered within 4 hours of these agents.
- Take SYNTHROID as a single dose, preferably on an empty stomach, one-half to one hour before breakfast. Levothyroxine absorption is increased on an empty stomach.
- Notify your physician if you experience any of the following symptoms: rapid or irregular heartbeat, chest pain, shortness of breath, leg cramps, headache, nervousness, irritability, sleeplessness, tremors, change in appetite, weight gain or loss, vomiting, diarrhea, excessive sweating, heat intolerance, fever, changes in menstrual periods, hives or skin rash, or any other unusual medical event.
- Notify your physician or dentist that you are taking SYNTHROID prior to any surgery.
- After a stable response has been established, it is important to have follow-up laboratory tests done, as ordered by your health care provider, at least annually.

This is the most important information to know about SYNTHROID. For more information, talk with your health care provider.
